

# HEV, PHEV, EV Testing Activities

July 22, 2013

**Michael Duoba,**  
Henning Lohse-Busch, Kevin Stutenberg, Eric Rask  
*Argonne National Laboratory*

**U.S. Department of Energy**

**Energy Efficiency and Renewable Energy**

Bringing you a prosperous future where energy is clean, abundant, reliable, and affordable

This presentation does not contain any proprietary, confidential, or otherwise restricted information

# Advanced Powertrain Research Facility

## Objective #1: Benchmarking

“Provide to DOE and Partners  
the Best Advanced Vehicle  
Test Data and Analysis”

## Objective #2: Codes and Standards

“Leading role in codes and  
standards development with  
public and independent  
research and data”

**4WD chassis  
dyno with  
thermal  
chamber**

**2WD  
chassis  
dyno**

# APRF Provides Data for a Wide Variety of Vehicle Technologies

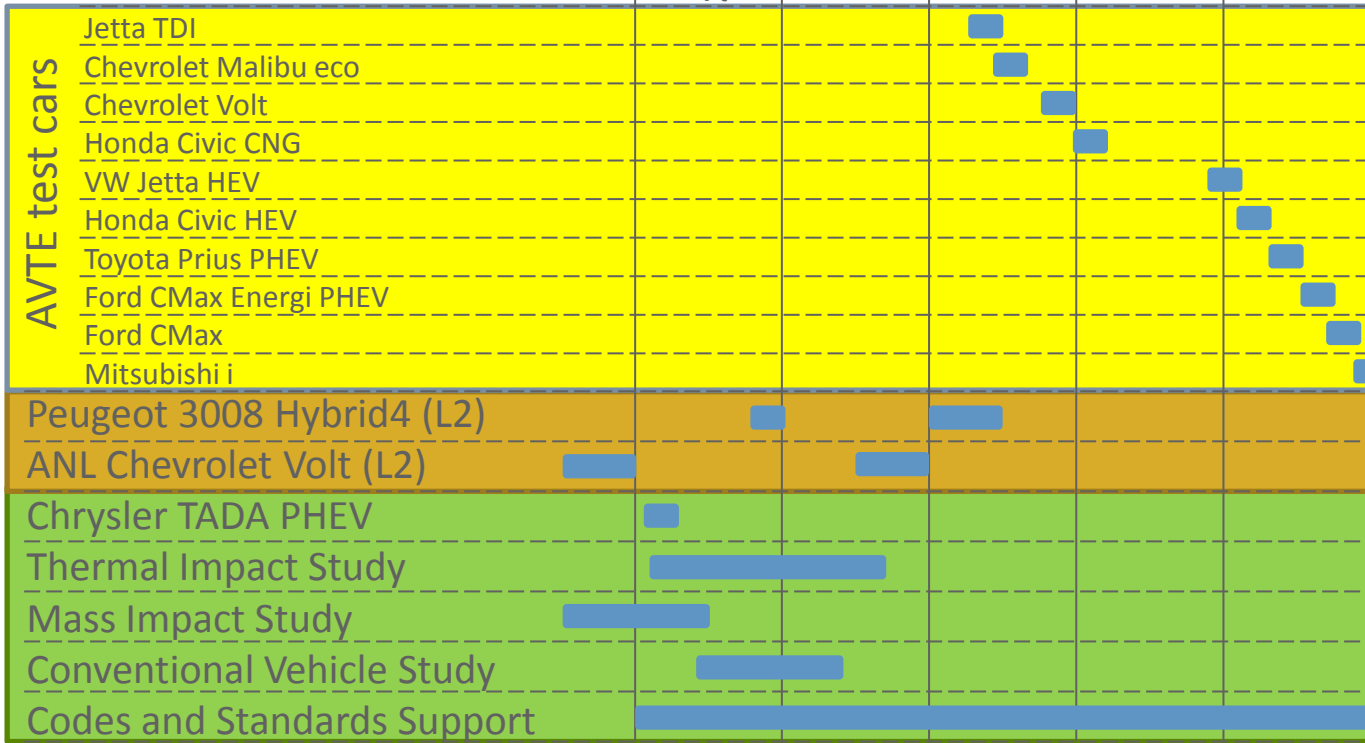

## Milestones

2012-Q3      2012 Q4      2013 Q1      2013 Q2      2013 Q3

Level 1

Level 2

Chrysler TADA

2013 Jetta TDI

2013 Civic CNG

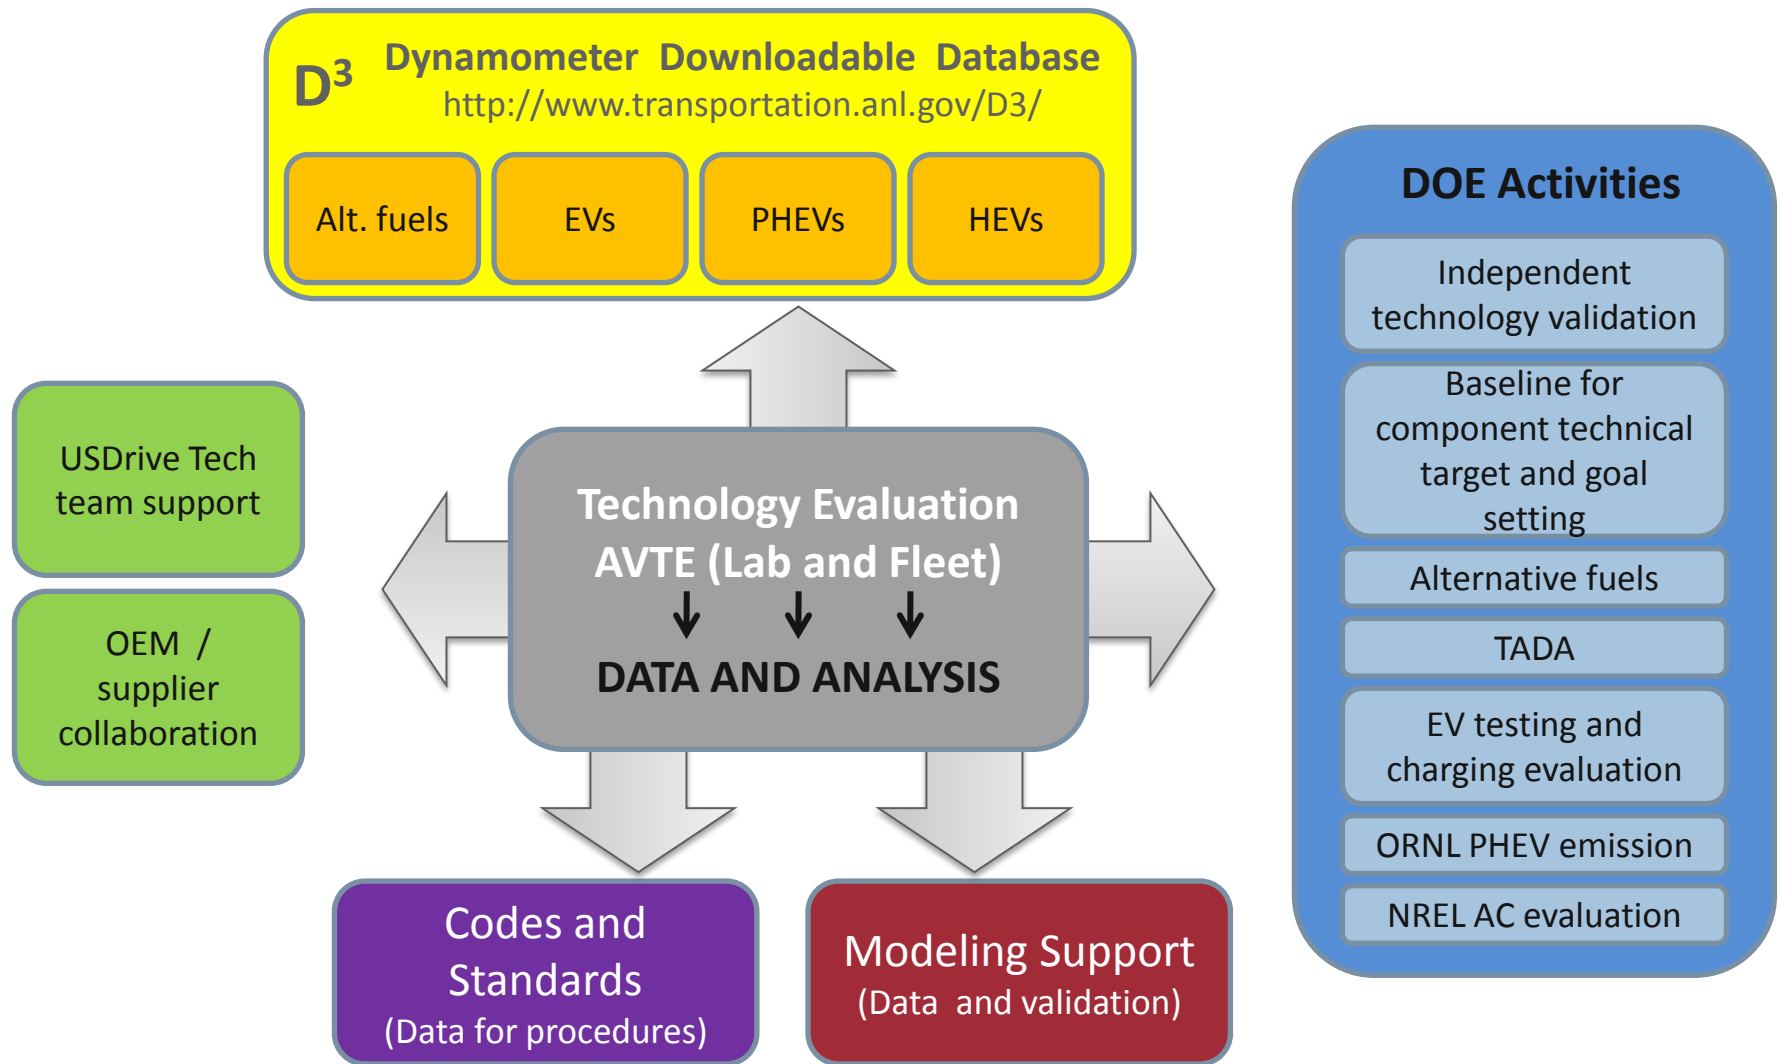

2013 Volt

2013 Malibu Eco

# Technology Assessment and Data Dissemination

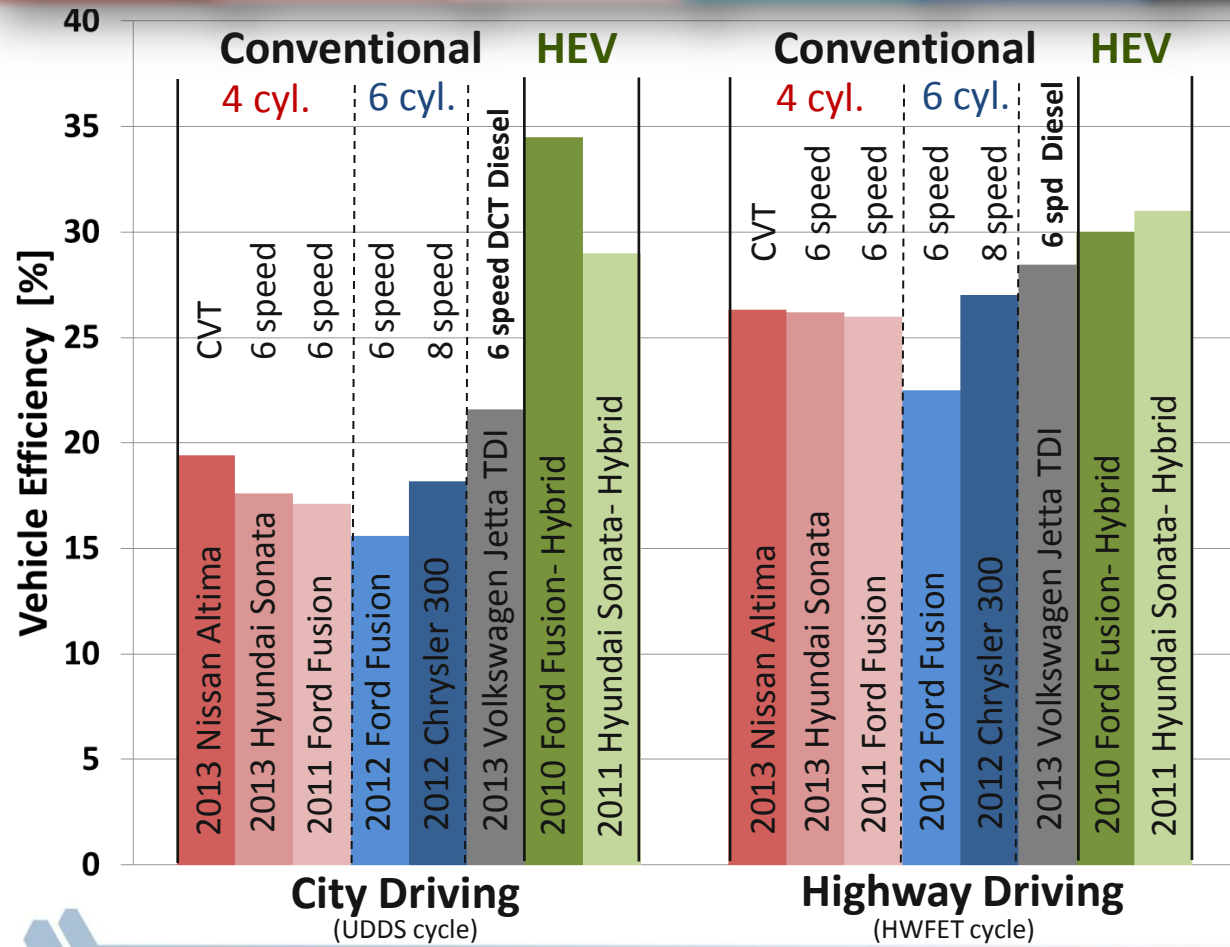

*"Knowing how good you are requires an accurate picture of how good everybody else is"*

# Important Data Across Many Types of Technologies

Vehicle efficiency = (Positive cycle energy at wheel) / (Cycle fuel energy)

- Vehicle efficiency is dependent on driving style
  - City driving: transient with lower loads and idle time impacts efficiency
  - Highway driving: higher steady engine loads result in greater average efficiency
- Technology observation
  - Engine size: smaller engine → higher average efficiency
  - CVT & 8 speed: enables optimized engine loading in city driving
  - Diesel: highest vehicle efficiency of conventional technology
  - HEV: increased freedom to leverage engine operation

# Impact of Temperature on BEV Range

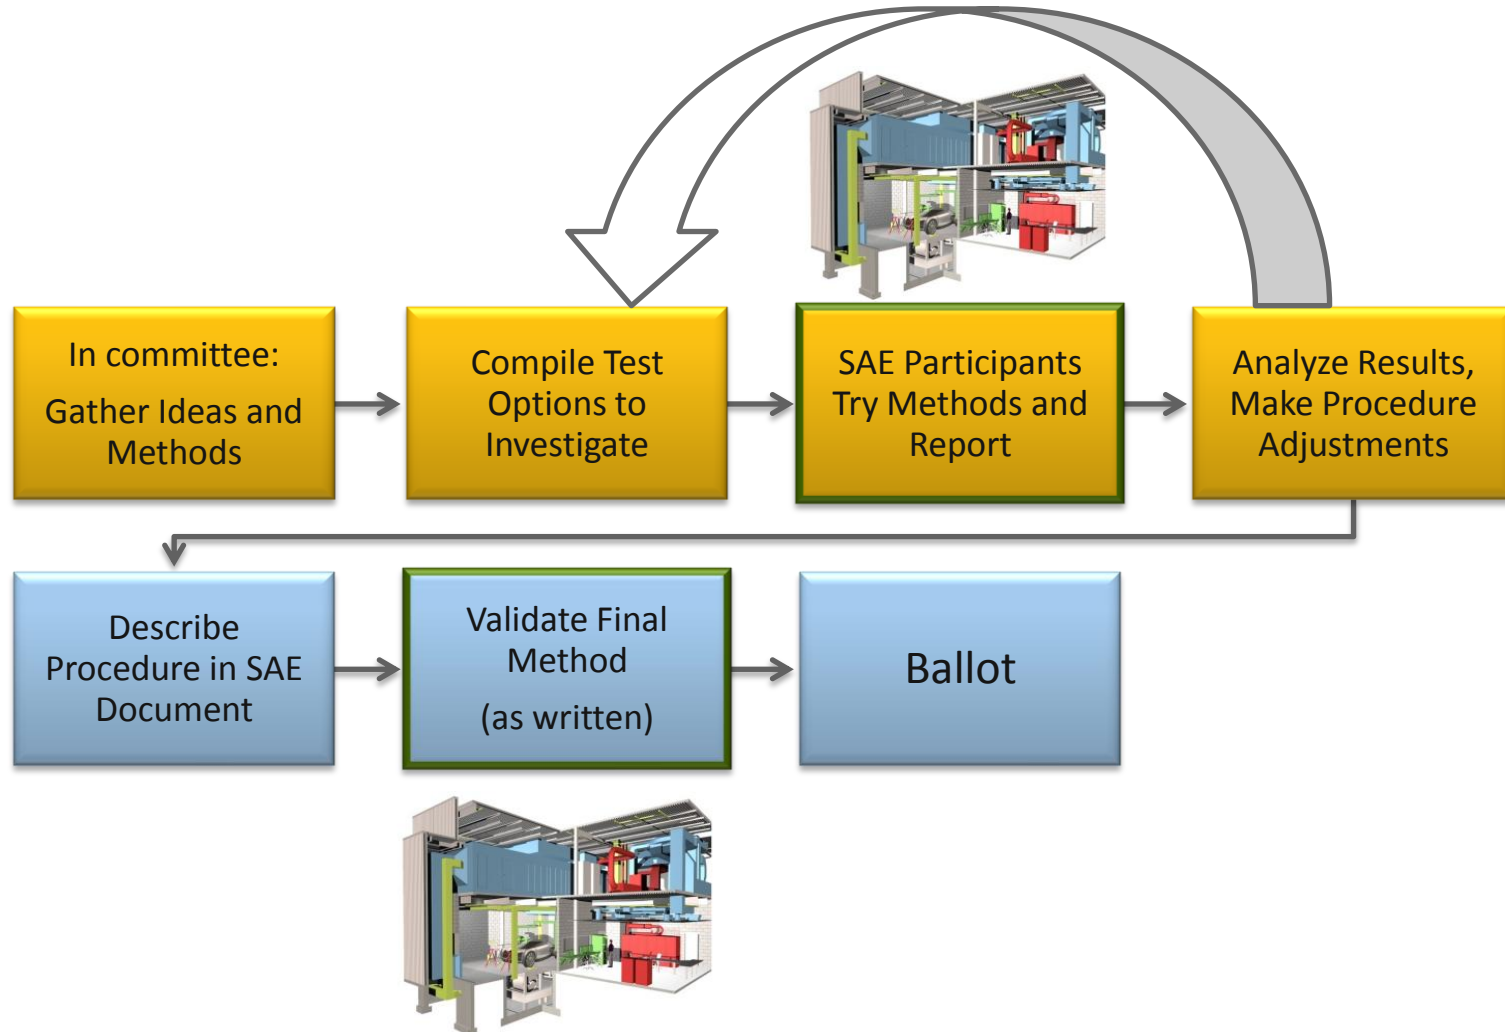

# Standards Activities Background

- **J1711: HEV/PHEV** dynamometer test procedures
  - Rewrite focused on PHEV procedure (published in 2010)
- **J1634: BEV** dynamometer test standards (consumption and range)
  - Rewrite for modern BEVs (published in 2012)
- **ISO 23274-2: PHEV** dyno testing in depleting mode
  - 23274-1 is testing in the sustaining mode (completed in 2012)
- **J2951: Drive Quality** Evaluation for Chassis Dynamometer Testing
  - Fuel economy variations based upon driver performance (New, published in 2011)
- **J1715: HEV Terminology** (“to EREV or not to EREV”)
  - Updated from version several years ago
- **J2711: Dyno testing of MD/HD** vehicles including HEV
  - Phase 1 = dyno procedures (Phase 2 & 3 are HIL and “powerpack” testing)
- **J????: Powertrain power** standards
  - Committee not yet formed. M. Duoba chairing.

# Argonne SAE Standards Committee Process

# Recent Accomplishments: Validation of SAE Procedures with Newly Available OEM Vehicles

## ■ **SAE J1634**

- Nissan Leaf and Tesla Roadster were testing using SAE J1634 procedure concepts
- Upcoming work will investigate results from Focus Electric (with active thermal management)
- Future work on Hot/Cold corrections for BEVs

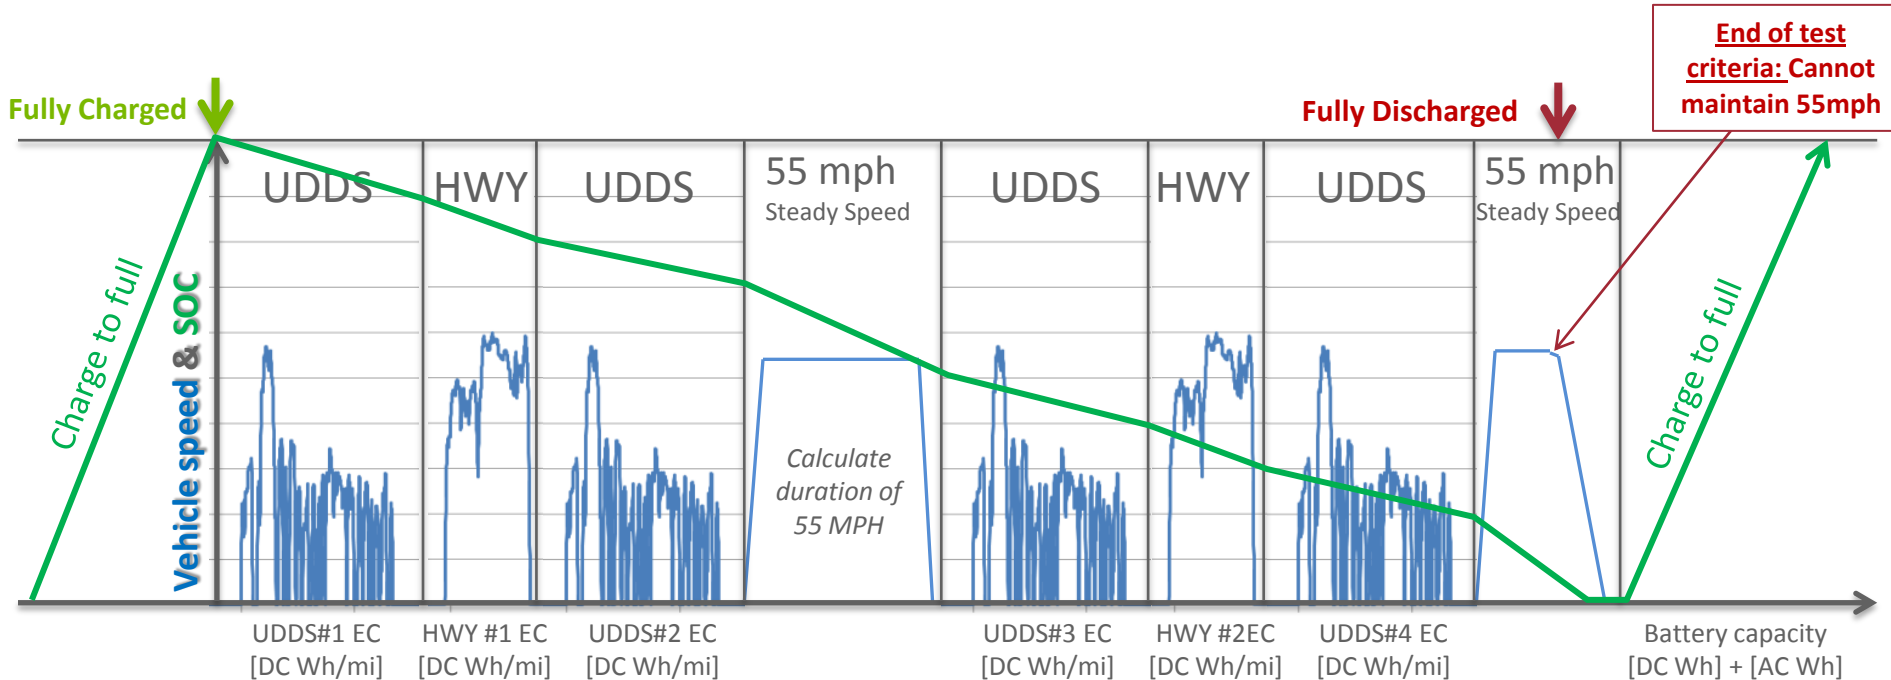

## ■ **SAE J1711**

- Old J1711 procedure not adequate for today's PHEVs
- Testing Volt validated J1711's sophisticated approach to range calculations
- Testing Prius PHV validated J1711 generic approach that works for EREVs and Blended PHEVs
- Current work focused on hot and cold testing in charge-depleting mode

# J1634 BEV Testing Procedure

→ “Multi-Cycle Test” - provides both UDDS and HWY data throughout SOC range. Expanded version includes US06 cycle data.

- Cycle data obtained at beginning and end of SOC
- Provides Wh/mi and range for both UDDS and HWY

# Expanded Multi-Cycle Test J1634 Used for Preliminary OEM BEV Testing

→ Expanded MCT provides UDDS, HWY and US06

**Charge Recovery**  
 $CR = C_c / C_d$   
 $CR = 63.69 \text{ Ah} / 63.49 \text{ Ah}$   
 $CR = 100.3\%$   
 (must be greater than 97%)

**AC Energy Consumption\***  
UDDS:  
 $AC \text{ Wh/mi} = DC \text{ Wh/mi} / RAF$   
 $AC \text{ Wh/mi} = 169.4 / 0.8447 = 200.5$

HWY:  
 Ave DC Wh/mi = 201.3  
 AC Wh/mi = 238.2

US06:  
 Ave DC Wh/mi = 284.8  
 AC Wh/mi = 337.1

**Range Extrapolations\***  
 Usable Battery Energy (UBE)  
 UBE = 20315 Wh

**UDDS**  
 $R = 20315 / 169.4 = 119.9 \text{ miles}$   
**HWY**  
 $R = 20315 / 201.3 = 100.9 \text{ miles}$   
**US06**  
 $R = 20315 / 284.8 = 71.3 \text{ miles}$

	Whr	Whr/mi
UDDS	1346.8	180.5
HWY	2092.7	203.5
UDDS	1275.2	171.0
US06	2302.1	286.8
SS55	3241.5	
US06	2268.5	282.8
UDDS	1251.0	167.7
HWY	2044.4	199.0
UDDS	1246.9	167.1
SS55	3245.7	
<b>Test Discharge</b>	<b>20315</b>	
<b>AC Recharge</b>	<b>24048</b>	

**Weighting UDDS for "First Cycle Effect"**  
 $K1 = 1346.8 / 20315 = 0.06629$   
 $K2 = K3 = K4 = (1 - 0.06629) / 3 = 0.31123$   
 $DC \text{ Wh/mi} = K1 * UDDS1 \text{ Wh/mi} + K2...$   
 $DC \text{ Wh/mi} = 169.4$

**Recharge Allocation Factor**  
 $RAF = DC \text{ kWh}_{total \text{ test}} / AC \text{ kWh}_{recharge}$   
 $RAF = 20315 / 24048 = 0.8447$

\* Note that these results are unadjusted and do not reflect expected in-use performance

# SAE J1711 Concepts Validated on Volt

Volt UDDS Full Charge Test Data

Cycle	Miles	MPG actual	Ah x (Vi+Vf) /2	EOT Criteria		AC Wh Calcs

<sup>1</sup> Based upon 13.102 AC kWh recharge to full

- End of Test Criteria checked for robustness. Argonne-prescribed option works best.
- Numerous SAE J1711 range definitions important for calculations of results.
- Same calculations for all PHEVs. PHEV type drives decision of which results are presented.

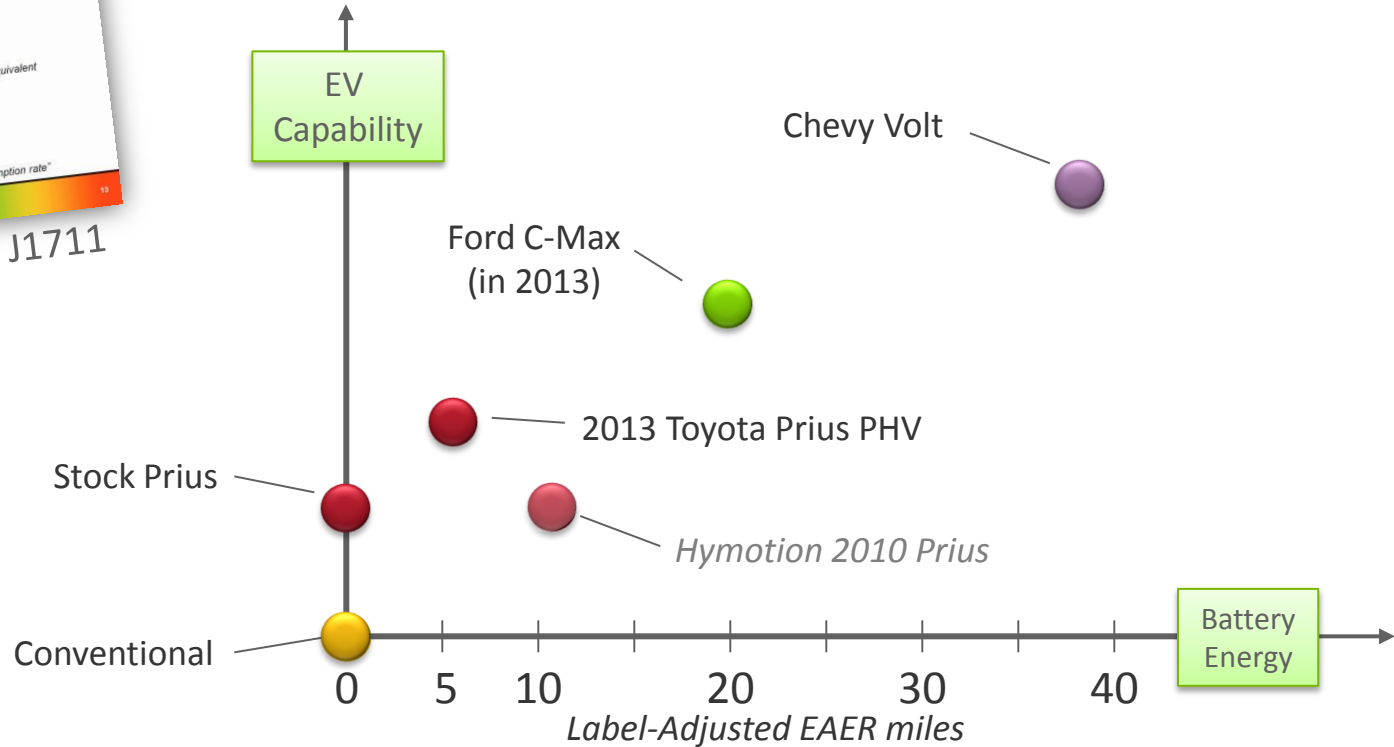

Argonne slide from 2007:

AER PHEV Platform Effort Will Fill-In Unexplored Design Space

PHEV equivalent = Based upon energy capacity and "theoretical EV consumption rate"

# Future Work: SAE J1711 Validation Over Entire PHEV Design Space

- J1711 developed using only prototypes
- However, no validation performed with OEM vehicles
- By end of 2013, most of PHEV design space can be tested with OEM PHEVs

# Future Work: New Standards and Continued Validation / Improvement of Existing Procedures

## Refinement:

- HEV and PHEV procedures (**J1711**) will be evaluated with diverse set of OEM PHEVs (Prius and C-Max PHEVs)
- More BEV and 5-Cycle evaluations
  - Current “**70% Rule**” should eventually be replaced with procedures that reflect and reward advances in BEV thermal management, efficient auxiliaries and improved thermal insulation

## New or Revised Standards:

- Newly formed SAE task addressing Powertrain Power in HEVs
  - Specifications in engine net power and torque currently follow SAE J1349
  - However, “specmanship” in hybrid vehicle power and electric motor power do not currently conform to a uniform standard
  - The new task force will address standard methods to define, measure, and report Vehicle Power, Motor Power, and Battery Power (among other parameters)
- Finish SAE **J2711-1** (Chassis dynamometer test procedures)

Argonne's Mike Duoba briefing President Obama on Testing Standards March 15, 2013
